

# Raw User Queries - This Chat Session

Verbatim, as typed, in order. Typos are preserved intentionally.

---

## Query 1

I want to build a 3 langgraph agents that takes user queries from cli it can in multi line text , even .txt and pdf file should take in put all this formats 3 agents are one is summarization of health report and second is synthesis health report generation and third is normal qna bot and i want u to build exactly according to my architecture plan i am , giving to use user query must at first go through input guardrails since its a healthcare project it it fails it should ask user sensitive topic or any things after that passes its should go to query contextualizers then should be classification of what to do summarize, synthesis data or normal qna and this should be done by llm we will use groq available model from this i have its api key. for this initialize project in rshi directory use uv and calude.md file from this before building 3 agents i will tell u one by one what needs to be done

---

## Query 2

lets start with agent 1 its summarization of health report it should summarize health report in 3 paragraph and if the documents contains prompt injection of other domain its should not show in summary and which model is best for summarization use that and build this agent at first

---

## Query 3

for health reports synthesis generation it should ask multiple question to user atleast 6 upto 10 depend upon user dont say its sufficient like this its should be 2 way communication and then should generate health report in pdf now lets build this

---

## Query 4

qna should be based on llm with prompt engineering and guardrails for off domain and its should have a detailed system prompt for greeting to generate qna only everything based on that build and make it an 3rd agent

---

## Query 5

now based on this build query contextualizer and input gura dils and wire them so taht user queries in cli directs to input gura d then passes or fals if passes goes to query contextualizers inside taht ut into 3 agets based on nedds for which its needs to go it should decide its accuately for user queries

---

## Query 6

i have one things insted of one model use differnt model for diffeent task

---

## Query 7

lets run thsi in cli

---

## Query 8

how to run thsi

---

## Query 9

give question to teast i am atesting

---

## Query 10

(with a screenshot attached) in cosnitent formata md it didn'ta sk question one by one fro sythesis re[ort genration for taht i nneedd fix

---

## Query 11

push thsi in new privatea nd also export thsis ession chat in pdf and add in repo lets do thsi

---

## Query 12

I need raw queries from this chat, export it in pdf, just give me the queries that I gave
